Week 10 Information Flow Tracking

Yulei Sui

University of Technology Sydney, Australia

Today's Class

What is Taint Analysis?

- Taint analysis aims to reason about the control and data dependence from a source (statement/node) to a sink (statement/node).
- Taint analysis can also be seen as information flow tracking analysis.
 - Static taint analysis: taint tracking at compile time (this subject)
 - Dynamic taint analysis: taint tracking during runtime.

What is Taint Analysis?

- Taint analysis aims to reason about the control and data dependence from a source (statement/node) to a sink (statement/node).
- Taint analysis can also be seen as information flow tracking analysis.
 - Static taint analysis: taint tracking at compile time (this subject)
 - Dynamic taint analysis: taint tracking during runtime.

Why learn Taint Analysis?

- Detect information leakage
 - A sensitive data stored in a heap object and manipulated by pointers can be passed around and stored to an unchecked memory (untrusted third-party APIs)
- Detect code vulnerability
 - There is a vulnerability if an unchecked tainted source (e.g., return value from an untrusted third party function) flows into one of the following sinks, where the tainted variable being used as
 - a parameter passing to a sensitive function or
 - a bound access (array index) or
 - a termination condition (loop condition)
 -

How to Perform Static Taint Analysis?

Let us use what we have learned about control- and data-dependence to develop an information flow checker to validate tainted flows from a source to a sink.

- A source v_{src}@s_{src} is a tuple consisting of a variable v_{src} and a statement s_{src} where v_{src} is defined.
- A sink v_{snk}@s_{snk} is also a tuple consisting of a variable v_{snk} and a statement s_{snk} where v_{snk} is used.
- In SVF, variables v_{src} and v_{snk} are PAGNodes. Statements s_{src} and s_{snk} are ICFGNodes.

How to Perform Static Taint Analysis?

Let us use what we have learned about control- and data-dependence to develop an information flow checker to validate tainted flows from a source to a sink.

- A source v_{src}@s_{src} is a tuple consisting of a variable v_{src} and a statement s_{src} where v_{src} is defined.
- A sink v_{snk}@s_{snk} is also a tuple consisting of a variable v_{snk} and a statement s_{snk} where v_{snk} is used.
- In SVF, variables v_{src} and v_{snk} are PAGNodes. Statements s_{src} and s_{snk} are ICFGNodes.
- Given a tainted source v_{src}@s_{src}, we say that a sink v_{snk}@s_{snk} is also tainted
 if both of the following two conditions satisfy:
 - (1) s_{src} reaches s_{snk} on the ICFG (Assignment 2), and
 - (2) v_{src} is aliased with v_{snk} , i.e., $pts(src) \cap pts(snk) \neq \emptyset$ (Assignment 3)

Example 1

```
int main(){
char* secretToken = tgetstr();  // source
char* a = secretToken;
char* b = a;
broadcast(b);  // sink
}
```

What is the tainted flow?

Example 1

```
int main(){
char* secretToken = tgetstr();  // source
char* a = secretToken;
char* b = a;
broadcast(b);  // sink
}
```

What is the tainted flow?

- Line 2 reaches Line 5 along the ICFG (control-dependence holds)
 secretToken and b are aliases (data-dependence holds)
- Both control-dependence and data-dependence hold. Therefore, secretToken@Line 2 flows to b@Line 5.

Example 2

```
int main(){
char* secretToken = tgetstr(...); // source
char* a = secretToken;
char* b = a;
char* publicToken = "hello";
broadcast(publicToken); // sink
}
```

Example 2

```
int main(){
char* secretToken = tgetstr(...); // source
char* a = secretToken;
char* b = a;
char* publicToken = "hello";
broadcast(publicToken); // sink
}
```

- Line 2 reaches Line 6 along the ICFG (control-dependence holds),
- secretToken and publicToken are not aliases (data-dependence does not hold),
- secretToken@Line 2 does not flow to b@Line 6.

Example 3

```
char* foo(char* token){ return token: }
   int main(){
        if(condition){
3
            char* secretToken = tgetstr(...); // source
            char* b = foo(secretToken);
5
        else{
            char* publicToken = "hello";
            char* a = foo(publicToken);
            broadcast(a):
                                                 // sink
10
11
12
```

Example 3

```
char* foo(char* token){ return token: }
    int main(){
        if(condition){
3
            char* secretToken = tgetstr(...); // source
            char* b = foo(secretToken);
5
        elsef
            char* publicToken = "hello";
            char* a = foo(publicToken);
9
            broadcast(a):
                                                 // sink
10
11
12
```

- secretToken and a are aliases due to callee foo (data-dependence holds),
- Line 4 does not reach Line 10 on ICFG (control-dependence does not hold),
- secretToken@Line 4 does not flow to b@Line 10.

Example 4

```
int main(){
        char* secretToken = tgetstr(...);
                                                             // source
        while(loopCondition){
            if(BranchCondition){
                char* a = secretToken;
                broadcast(a);
                                                           // sink
            else{
                char* b = "hello":
10
11
12
```

How many tainted flows from source to sink?

Example 4

```
int main(){
        char* secretToken = tgetstr(...);
                                                             // source
        while(loopCondition){
            if (BranchCondition) {
                char* a = secretToken;
                broadcast(a):
                                                           // sink
            else{
                char* b = "hello":
10
11
12
```

How many tainted flows from source to sink?

- (At least) two paths from Line 2 to Line 6 on ICFG (control-dependence holds),
- secretToken and a are aliases (data-dependence holds),
- secretToken@Line 2 have two tainted paths flowing to b@Line 6.

Configuring Sources and Sinks for Taint Analysis

Aim: enable different taint tracking patterns by defining/configuring sources and sinks.

 Given a source v_{src}@s_{src} and a sink v_{snk}@s_{snk}, in this class, we are interested in the case that s_{src} and s_{snk} are both API calls, i.e., CallBlockNode in SVF.

Configuring Sources and Sinks for Taint Analysis

Aim: enable different taint tracking patterns by defining/configuring sources and sinks.

- Given a source v_{src}@s_{src} and a sink v_{snk}@s_{snk}, in this class, we are interested in the case that s_{src} and s_{snk} are both API calls, i.e., CallBlockNode in SVF.
- v_{src} is a return value from the call statement s_{src}.
- \mathbf{v}_{snk} is a parameter passing to a call statement \mathbf{s}_{snk} .

Configuring Sources and Sinks for Taint Analysis

Aim: enable different taint tracking patterns by defining/configuring sources and sinks.

- Given a source v_{src}@s_{src} and a sink v_{snk}@s_{snk}, in this class, we are interested in the case that s_{src} and s_{snk} are both API calls, i.e., CallBlockNode in SVF.
- v_{src} is a return value from the call statement s_{src}.
- \mathbf{v}_{snk} is a parameter passing to a call statement \mathbf{s}_{snk} .
- We can identify s_{src} and s_{snk} according to different APIs, so as to configure sources and sinks.
- In our Example 1, variable secretToken is V_{src} and b is V_{snk}. The call statement tgetstr(..) represents S_{src} and broadcast(..) are used for S_{snk}.

Assignment 4

- Code template and specification: https://github.com/SVF-tools/SVF-Teaching/wiki/Assignment-4
- Make sure your previously implementations in Assignment-2.cpp and Assignment-3.cpp are in place.
 - Class TaintGraphTraversal in Assignment 4 is a child class of 'ICFGTraversal'. TaintGraphTraversal will use the DFS method implemented in Assignment 2 for control-flow traversal.
 - Andersen's analysis implemented in Assignment 3 will also be used for checking aliases between two pointers.

Assignment 4

- You will need to implement two tasks in Assignment 4 with the second one having 5 bonus points.
 - Task 1 (Compulsory)
 - Implement method readSrcSnkFromFile in Assignment-4.cpp using C++ file reading to configure sources and sinks.
 - Implement method printICFGPath to collect the tainted ICFG paths and add each path (a sequence of node IDs) as a string into std::set<std::string> paths similar to Assignment 2
 - Implement method aliasCheck to check aliases of the variables at source and sink.

Assignment 4

- You will need to implement two tasks in Assignment 4 with the second one having 5 bonus points.
 - Task 1 (Compulsory)
 - Implement method readSrcSnkFromFile in Assignment-4.cpp using C++ file reading to configure sources and sinks.
 - Implement method printICFGPath to collect the tainted ICFG paths and add each path (a sequence of node IDs) as a string into std::set<std::string> paths similar to Assignment 2
 - Implement method aliasCheck to check aliases of the variables at source and sink.
 - Task 2 (5 bonus points)
 - Dump the taint program paths into a text file
 - Implement a VSCode extension to annotate and visualize the tainted paths from a source to a sink.

C++ File Reading

Implement method readSrcSnkFormFile in Assignment-4.cpp to parse the two lines from SrcSnk.txt in the form of

```
line 1 contains source APIs "{ api1, api2, api3 }"
line 2 contains sink APIs "{ api1, api2, api3 }"
```

Please refer to the following links (among many others) for C++ file reading:

- https://www.tutorialspoint.com/cplusplus/cpp_files_streams.htm
- https://www.cplusplus.com/doc/tutorial/files/
- https://linuxhint.com/cplusplus_read_write/
- https://opensource.com/article/21/3/ccc-input-output

Visualizing Tainted Paths (5 bonus points)

This task is optional and there is no uniform answer! Some hits as below but you are also encouraged to design and implement your own approach.

- Output taint paths into a text file in the following format for example, ' $\{$ In: number cl: number, fl: name $\} \rightarrow \{$ In: number, cl: number, fl: name $\} \rightarrow \{$ In: number, cl: number, fl: name $\}$ '.
- Create a VSCode extension to read the text file
- Annotate the target source file (e.g., example.c) based on the taint paths reading from the text file.

Two VSCode extension examples (note that they are just general examples for references and are **NOT** the solution to the task):

```
https://github.com/akshatsinghkaushik/vscode-extension-example
https://github.com/spcidealacm/codepointer_js
```

VSCode Extension Demo (You feel free to design yours)
