Where We Are Now and Today's Class

Where We Are Now and Today's Class

Where We Are Now and Today's Class
What is LLVM ?

Low-Level Virtual Machine (LLVM) compiler infrastructure is a collection of compiler and tool-chain technologies.

- Originally started in 2000 from UIUC. An **open-source project** and supported and contributed by a range of high-tech companies such as Apple, Google, Intel, ARM.
- Modern compiler infrastructure can be used to develop a **front-end for any programming language** and a **back-end for any instruction set architecture**.
- A set of **reusable software modules** to quickly design your own compiler or software tool chains.
- **Language-independent intermediate representation (IR)** used for a variety of purposes, such as compiler optimizations, static analysis and bug detection.
- **More information on LLVM's website:** `https://llvm.org/`

# Why Learn LLVM or Learn Compilers in General?

- An essential part of the standard curriculum in computer science.
- One of the most complex system for building virtually all other software.
- Sharpen your software design and implementation skills.
- Widely used by many major software companies. In-demand skills and competitive salaries in job market.

LLVM's Architecture

Source Code — Front End — Optimizer Passes — Back End — Machine Code

.c/.cpp, swift, Rust → Clang → IR → pass1 pass2 ••• → IR → Code Generation → X86, ARM, Power PC

*IR: **Human-readable LLVM IR (.ll files) or dense 'bitcode' binary representation (.bc files)**

LLVM's Architecture

Source Code — Front End — Optimizer Passes — Back End — Machine Code

- **-loop-vectorize:** Loop Vectorization
- **-loop-unroll:** Loop Unrolling
- **-dse:** Dead Store Elimination
- **-mem2reg:** Promote Memory to Register

*IR: **Human-readable LLVM IR (.ll files) or dense 'bitcode' binary representation (.bc files)**

Software Analysis   https://github.com/SVF-tools/SVF-Teaching

LLVM Intermediate Representation (IR)

LLVM IR is LLVM's code representation which is generated by its front-end `clang` **when compiling a program** (https://llvm.org/docs/LangRef.html)

- **Language independent**. Not machine code, but one step just above assembly

LLVM Intermediate Representation (IR)

LLVM IR is LLVM's code representation which is generated by its front-end `clang` **when compiling a program** (https://llvm.org/docs/LangRef.html)

- **Language independent**. Not machine code, but one step just above assembly
- **Clear lexical scope**, such as modules, functions, basic blocks, and instructions

LLVM Intermediate Representation (IR)

LLVM IR is LLVM's code representation which is generated by its front-end `clang` **when compiling a program** (https://llvm.org/docs/LangRef.html)

- **Language independent**. Not machine code, but one step just above assembly
- **Clear lexical scope**, such as modules, functions, basic blocks, and instructions
- **3-address code style** in **static single assignment (SSA)** form

LLVM Intermediate Representation (IR)

LLVM IR is LLVM's code representation which is generated by its front-end `clang` **when compiling a program** (https://llvm.org/docs/LangRef.html)

- **Language independent**. Not machine code, but one step just above assembly
- **Clear lexical scope**, such as modules, functions, basic blocks, and instructions
- **3-address code style** in **static single assignment (SSA)** form
  - Variables are strongly typed
  - Global variable (symbol starting with '@')
  - Stack/register variable (symbol starting with '%')
  - Three addresses and one operator.
    - For example, 'a = b op c', where 'a', 'b', 'c' are either programmer defined variables (e.g., heap, global or stack), constants or compiler-generated temporary names. 'op' stands for an operation which is applied on 'a' and 'b'.

Compiling a C Program to Its LLVM IR
Clang/LLVM compiler options

- Compile a C program 'swap.c' to a human readable IR 'example.ll'.
  - `clang -c -S -emit-llvm swap.c -o swap.ll`
- Compilation without optimisation.
  - `clang -c -S -Xclang -disable-O0-optnone -emit-llvm swap.c -o swap.ll`
- Keep the variable names.
  - `clang -c -S -fno-discard-value-names -Xclang -disable-O0-optnone -emit-llvm swap.c -o swap.ll`
- Convert the LLVM IR to SSA form's IR for later static analysis.
  - `opt -S -mem2reg swap.ll -o swap.ll`

Compiling a C Program to Its LLVM IR
An example

```c
void swap(char **p, char **q){
    char* t = *p;
    *p = *q;
    *q = t;
}
int main(){
    char a1;
    char *a;
    char b1;
    char *b;
    a = &a1;
    b = &b1;
    swap(&a,&b);
}
```

swap.c

compile
⇨

```llvm
define void @swap(i8** %p, i8** %q) #0 {
entry:
%0 = load i8*, i8** %p, align 8
%1 = load i8*, i8** %q, align 8
store i8* %1, i8** %p, align 8
store i8* %0, i8** %q, align 8
ret void
}

define i32 @main() #0 {
entry:
%a1 = alloca i8, align 1
%a = alloca i8*, align 8
%b1 = alloca i8, align 1
%b = alloca i8*, align 8
store i8* %a1, i8** %a, align 8
store i8* %b1, i8** %b, align 8
call void @swap(i8** %a, i8** %b)
ret i32 0
}
```

swap.ll

C code to LLVM's IR
An example

```c
void swap(char **p, char **q){
    char* t = *p;
    *p = *q;
    *q = t;
}
int main(){
    char a1;
    char *a;
    char b1;
    char *b;
    a = &a1;
    b = &b1;
    swap(&a,&b);
}
```

swap.c

compile
⇨

```llvm
define void @swap(i8** %p, i8** %q) #0 {
entry:
%0 = load i8*, i8** %p, align 8
%1 = load i8*, i8** %q, align 8
store i8* %1, i8** %p, align 8
store i8* %0, i8** %q, align 8
ret void
}
```

```llvm
define i32 @main() #0 {
entry:
%a1 = alloca i8, align 1
%a = alloca i8*, align 8
%b1 = alloca i8, align 1
%b = alloca i8*, align 8
store i8* %a1, i8** %a, align 8
store i8* %b1, i8** %b, align 8
call void @swap(i8** %a, i8** %b)
ret i32 0
}
```
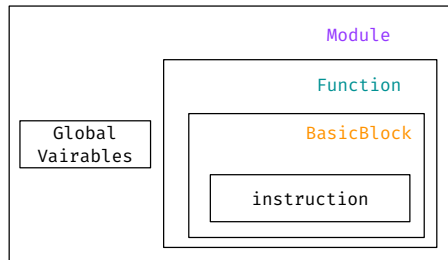

Function

BasicBlock

Instruction

swap.ll

LLVM Intermediate Representation (IR)
Structure Organization

LLVM-IR Scopes

Module contrains **Functions** and **Global Variables**
 - Whole module is the unit of translation, analysis and optimization.

Function contrains **BasicBlocks** and **Arguments**, which correspond to functions.

BasicBlock contains list of instructions.
 - Each block is contiguous chunck of instructions

Instruction is opcode + vector of operands in '3-address' style
 - All operands have types
 - Instruction result is typed

LLVM Intermediate Representation (IR)
LLVM Instructions

```
int main()
{
    char a1;
    char *a;
    char b1;
    char *b;
    a = &a1;
    b = &b1;
    swap(&a,&b);
}
```

```
define i32 @main() #0 {
entry:
%a1 = alloca i8, align 1
%a = alloca i8*, align 8
%b1 = alloca i8, align 1
%b = alloca i8*, align 8
store i8* %a1, i8** %a, align 8
store i8* %b1, i8** %b, align 8
call void @swap(i8** %a, i8** %b)
ret i32 0
}
```

```
%a1 = alloca i8, align 1
```

register
variable

```
identifiers:
  [% / @] [-a-zA-Z$._][-a-zA-Z$._0-9]
   - % is for local variable
   - @ is for global
   - temporary variables are numbered
```

LLVM Intermediate Representation (IR)
LLVM Instructions

```
int main()                define i32 @main() #0 {
{                         entry:
    char a1;              %a1 = alloca i8, align 1
    char *a;              %a = alloca i8*, align 8
    char b1;              %b1 = alloca i8, align 1
    char *b;              %b = alloca i8*, align 8
    a = &a1;              store i8* %a1, i8** %a, align 8
    b = &b1;              store i8* %b1, i8** %b, align 8
    swap(&a,&b);          call void @swap(i8** %a, i8** %b)
}                         ret i32 0
                          }
```

```
%a1 = alloca i8, align 1
```

register variable → %a1

instruction → alloca

identifiers:
```
[% / @] [-a-zA-Z$._][-a-zA-Z$._0-9]
```
  - % is for local variable
 - @ is for global
  - temporary variables are numbered

alloca: instruction allocates i8 (sizeof) bytes of memory on run-time stack

LLVM Intermediate Representation (IR)
LLVM Instructions

```
int main()
{
    char a1;
    char *a;
    char b1;
    char *b;
    a = &a1;
    b = &b1;
    swap(&a,&b);
}
```

```
define i32 @main() #0 {
entry:
%a1 = alloca i8, align 1
%a = alloca i8*, align 8
%b1 = alloca i8, align 1
%b = alloca i8*, align 8
store i8* %a1, i8** %a, align 8
store i8* %b1, i8** %b, align 8
call void @swap(i8** %a, i8** %b)
ret i32 0
}
```

```
%a1 = alloca i8, align 1
```

register variable → instruction, 8 bit-integer, memory alignment

identifiers:
  [% / @] [-a-zA-Z$._][-a-zA-Z$._0-9]
  - % is for local variable
  - @ is for global
  - temporary variables are numbered

alloca: instruction allocates i8 (sizeof) bytes of memory on run-time stack

align: indicates the memory operation should be aligned to 1 byte

LLVM Intermediate Representation (IR)
LLVM Instructions

```
int main()
{
    char a1;
    char *a;
    char b1;
    char *b;
    a = &a1;
    b = &b1;
    swap(&a,&b);
}
```

```
define i32 @main() #0 {
entry:
%a1 = alloca i8, align 1
%a = alloca i8*, align 8
%b1 = alloca i8, align 1
%b = alloca i8*, align 8
store i8* %a1, i8** %a, align 8
store i8* %b1, i8** %b, align 8
call void @swap(i8** %a, i8** %b)
ret i32 0
}
```

```
%a = alloca i8*, align 8
```

↙

```
allocate 8-bit integer pointer for a
```

LLVM Intermediate Representation (IR)
LLVM Instructions

```
int main()
{
    char a1;
    char *a;
    char b1;
    char *b;
    a = &a1;
    b = &b1;
    swap(&a,&b);
}
```

```
define i32 @main() #0 {
entry:
%a1 = alloca i8, align 1
%a = alloca i8*, align 8
%b1 = alloca i8, align 1
%b = alloca i8*, align 8
store i8* %a1, i8** %a, align 8
store i8* %b1, i8** %b, align 8
call void @swap(i8** %a, i8** %b)
ret i32 0
}
```

```
%b1 = alloca i8, align 1
```

↓

```
allocate 8-bit integer for b1
```

LLVM Intermediate Representation (IR)
LLVM Instructions

```
%b = alloca i8*, align 8
```

```c
int main()
{
    char a1;
    char *a;
    char b1;
    char *b;
    a = &a1;
    b = &b1;
    swap(&a,&b);
}
```

```llvm
define i32 @main() #0 {
entry:
%a1 = alloca i8, align 1
%a = alloca i8*, align 8
%b1 = alloca i8, align 1
%b = alloca i8*, align 8
store i8* %a1, i8** %a, align 8
store i8* %b1, i8** %b, align 8
call void @swap(i8** %a, i8** %b)
ret i32 0
}
```

allocate 8-bit integer pointer for b

LLVM Intermediate Representation (IR)
LLVM Instructions

```
store i8* %a1, i8** %a align 8
```
instruction

8-bit integer typed pointer %a1

```c
int main()
{
    char a1;
    char *a;
    char b1;
    char *b;
    a = &a1;
    b = &b1;
    swap(&a,&b);
}
```

```llvm
define i32 @main() #0 {
entry:
%a1 = alloca i8, align 1
%a = alloca i8*, align 8
%b1 = alloca i8, align 1
%b = alloca i8*, align 8
store i8* %a1, i8** %a, align 8
store i8* %b1, i8** %b, align 8
call void @swap(i8** %a, i8** %b)
ret i32 0
}
```
store the pointer %a1 to the memory
location that %a points to

LLVM Intermediate Representation (IR)
LLVM Instructions

```
store i8* %b1, i8** %b align 8
```

instruction

8-bit integer typed pointer %b1

```
int main()
{
    char a1;
    char *a;
    char b1;
    char *b;
    a = &a1;
    b = &b1;
    swap(&a,&b);
}
```

```
define i32 @main() #0 {
entry:
%a1 = alloca i8, align 1
%a = alloca i8*, align 8
%b1 = alloca i8, align 1
%b = alloca i8*, align 8
store i8* %a1, i8** %a, align 8
store i8* %b1, i8** %b, align 8
call void @swap(i8** %a, i8** %b)
ret i32 0
}
```

store the pointer %b1 to the memory
location that %b points to

LLVM Intermediate Representation (IR)
LLVM Instructions

```
call void @swap(i8** %a, i8** %b)
```
function call   function name   typed params

```
int main()
{
    char a1;
    char *a;
    char b1;
    char *b;
    a = &a1;
    b = &b1;
    swap(&a,&b);
}
```

```
define i32 @main() #0 {
entry:
%a1 = alloca i8, align 1
%a = alloca i8*, align 8
%b1 = alloca i8, align 1
%b = alloca i8*, align 8
store i8* %a1, i8** %a, align 8
store i8* %b1, i8** %b, align 8
call void @swap(i8** %a, i8** %b)
ret i32 0
}
```

```
call instruction will be
used to build control flow.
```
